Garment Warping & Fitting Research for Virtual Try-On Systems (Member-3)

LOYA PRANAY (pranay8679@gmail.com)

Date: 30-05-2026

1. Introduction

Virtual Try-On (VTON) systems aim to digitally fit garments onto a user's body while maintaining realistic appearance, proper alignment, and natural garment behaviour. One of the most important stages in a Virtual Try-On pipeline is garment warping and fitting.

Garment warping refers to the process of transforming a clothing image or 3D garment model so that it matches the body shape, posture, and proportions of a target user. Fitting techniques ensure that garments appear naturally worn rather than simply overlaid on top of the body.

Modern AI-based Virtual Try-On systems use computer vision, pose estimation, body segmentation, geometric transformations, and deep learning models to achieve realistic fitting results.

This research explores major garment warping and fitting techniques including:

- Thin Plate Spline (TPS)
 - Flow-Based Warping
 - CP-VTON
 - VITON-HD
 - Geometric Matching Module (GMM)
-

2. Objectives

The primary objectives of this research are:

- Understand garment warping techniques
 - Study clothing adaptation to body shapes
 - Analyse fitting methods used in Virtual Try-On systems
 - Compare major garment alignment architectures
 - Identify strengths and limitations of each approach
 - Recommend suitable solutions for future implementation
-

3. Importance of Garment Warping

In Virtual Try-On systems, garments cannot simply be pasted onto a person's image. Different users have:

- Different body shapes
- Different body sizes
- Different poses
- Different camera angles

Without garment warping, clothing appears unrealistic and misaligned.

Garment warping helps:

- Align clothing with body posture
 - Adjust garment dimensions
 - Preserve garment texture
 - Improve realism
 - Reduce visual artifacts
-

4. Thin Plate Spline (TPS)

Overview

Thin Plate Spline (TPS) is a geometric transformation technique widely used for image warping. TPS deforms garments smoothly based on body landmarks and control points.

The algorithm calculates transformations that minimize distortion while adapting clothing to the target body.

Warped Garment Output

Advantages

- Smooth transformations
- Computationally efficient
- Easy implementation
- Good alignment quality

Limitations

- Limited handling of complex deformations
- Performance decreases with extreme poses

Applications

- Virtual Try-On systems
- Medical image registration
- Object alignment
- Computer vision tasks

5. Flow-Based Warping

Overview

Flow-Based Warping uses optical flow estimation to determine pixel-level movement between garment and body images.

Instead of relying only on geometric transformations, flow-based approaches estimate how every pixel should move to match the target body.

Garment Warping

↓

Fitted Output

Advantages

- Handles complex deformations
- Better texture preservation
- Accurate fitting

Limitations

- Higher computational cost
- Requires larger training datasets

Applications

- Advanced Virtual Try-On systems
- Video-based fitting
- Motion adaptation

6. CP-VTON

Overview

CP-VTON (Characteristic-Preserving Virtual Try-On Network) is one of the earliest deep-learning-based Virtual Try-On frameworks.

The system preserves garment characteristics while adapting clothing to the user.

Final Output

Features

- Characteristic preservation
- TPS-based garment warping

- End-to-end architecture
- Improved garment alignment

Advantages

- Lightweight architecture
- Good visual results
- Preserves garment textures

Limitations

- Limited resolution
- Struggles with complex poses

7. VITON-HD

Overview

VITON-HD is an improved high-resolution Virtual Try-On framework designed to generate realistic garment fitting results.

The system improves texture preservation and garment details compared to earlier VTON approaches.

High-Resolution Output

Features

- High-resolution output
- Better texture quality
- Improved realism
- Enhanced garment details

Advantages

- State-of-the-art results
- Better visual quality
- Realistic garment fitting

Limitations

- High computational requirements
- Longer inference time

8. Geometric Matching Module (GMM)

Overview

Geometric Matching Module (GMM) is a neural network component responsible for aligning garments with target body shapes.

GMM predicts transformation parameters that map garment images to user body regions.

Garment Alignment

Advantages

- Accurate alignment
- Learns body-garment relationships
- Flexible fitting

Limitations

- Requires training data
- Sensitive to segmentation quality

9. Technology Comparison

Technology	Realism	Complexity	Speed	Texture Preservation
TPS	Medium	Low	High	Medium
Flow-Based Warping	High	High	Medium	High
CP-VTON	High	Medium	Medium	High
VITON-HD	Very High	High	Medium	Very High
GMM	High	Medium	High	High

10. Garment Warping Workflow

11. Research Findings

Best Geometric Warping Method

TPS

Reason:

- Fast
- Lightweight
- Easy implementation

Best Deep Learning Approach

CP-VTON

Reason:

- Characteristic preservation
- Good alignment quality

Best High-Resolution Output

VITON-HD

Reason:

- Realistic fitting
- High visual quality

Best Overall Alignment Module

GMM

Reason:

- Learns garment-body relationships
- Flexible adaptation

12. Challenges Identified

Several challenges were identified during the study:

Body Shape Variations

Different body types require adaptive fitting methods.

Pose Variations

Extreme poses create alignment difficulties.

Texture Preservation

Maintaining garment details remains challenging.

Occlusion Handling

Arms, hair, and accessories may block clothing regions.

Real-Time Processing

High-quality warping often increases computational requirements.

13. Recommended Solution

For future Virtual Try-On development:

GMM + TPS + VITON-HD

Benefits:

- Accurate garment alignment
 - High-resolution output
 - Better texture preservation
 - Improved realism
 - Scalable architecture
-

14. Future Improvements

Potential improvements include:

- 3D garment fitting
 - Real-time cloth simulation
 - Physics-based garment deformation
 - Multi-view fitting
 - Personalized body measurements
 - AI-based fabric behaviour modelling
-

15. Conclusion

This research explored major garment warping and fitting techniques used in modern Virtual Try-On systems. TPS, Flow-Based Warping, CP-VTON, VITON-HD, and GMM were analysed based on realism, fitting quality, computational complexity, and scalability.

The findings indicate that TPS provides efficient geometric alignment, GMM improves body-garment matching, and VITON-HD delivers the highest visual quality. A combination of GMM, TPS, and VITON-HD is recommended for future Virtual Try-On systems due to its balance between realism, performance, and scalability.
